

Linux-Foundation

Exam Questions CKS

Certified Kubernetes Security Specialist (CKS) Exam

NEW QUESTION 1

Create a network policy named restrict-np to restrict to pod nginx-test running in namespace testing. Only allow the following Pods to connect to Pod nginx-test:

- * 1. pods in the namespace default
- * 2. pods with label version:v1 in any namespace.

Make sure to apply the network policy.

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

Send us your Feedback on this.

NEW QUESTION 2

Given an existing Pod named test-web-pod running in the namespace test-system

Edit the existing Role bound to the Pod's Service Account named sa-backend to only allow performing get operations on endpoints.

Create a new Role named test-system-role-2 in the namespace test-system, which can perform patch operations, on resources of type statefulsets.

Create a new RoleBinding named test-system-role-2-binding binding the newly created Role to the Pod's ServiceAccount sa-backend.

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

Send us your feedback on this.

NEW QUESTION 3

Enable audit logs in the cluster, To Do so, enable the log backend, and ensure that

- * 1. logs are stored at /var/log/kubernetes-logs.txt.
- * 2. Log files are retained for 12 days.
- * 3. at maximum, a number of 8 old audit logs files are retained.
- * 4. set the maximum size before getting rotated to 200MB

Edit and extend the basic policy to log:

- * 1. namespaces changes at RequestResponse
- * 2. Log the request body of secrets changes in the namespace kube-system.
- * 3. Log all other resources in core and extensions at the Request level.
- * 4. Log "pods/portforward", "services/proxy" at Metadata level.
- * 5. Omit the Stage RequestReceived

All other requests at the Metadata level

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

Kubernetes auditing provides a security-relevant chronological set of records about a cluster. Kube-apiserver performs auditing. Each request on each stage of its execution generates an event, which is then pre-processed according to a certain policy and written to a backend. The policy determines what's recorded and the backends persist the records.

You might want to configure the audit log as part of compliance with the CIS (Center for Internet Security) Kubernetes Benchmark controls.

The audit log can be enabled by default using the following configuration in cluster.yml:

services:

kube-api:

audit_log:

enabled:true

When the audit log is enabled, you should be able to see the default values at

/etc/kubernetes/audit-policy.yaml

The log backend writes audit events to a file in JSONlines format. You can configure the log audit backend using the following kube-apiserver flags:

--audit-log-path specifies the log file path that log backend uses to write audit events. Not specifying thi flag disables log backend. - means standard out

--audit-log-maxbackup defines the maximum number of audit log files to retain

--audit-log-maxsize defines the maximum size in megabytes of the audit log file before it gets rotated

If your cluster's control plane runs the kube-apiserver as a Pod, remember to mount the location of the policy file and log file, so that audit records are persisted.

For example:-hostPath-to the

--audit-policy-file=/etc/kubernetes/audit-policy.yaml\

--audit-log-path=/var/log/audit.log-

NEW QUESTION 4

Fix all issues via configuration and restart the affected components to ensure the new setting takes effect. Fix all of the following violations that were found against the Ae PI server:

- * a. Ensure the --authorization-mode argument includes RBAC
- * b. Ensure the --authorization-mode argument includes Node
- * c. Ensure that the --profiling argument is set to false

Fix all of the following violations that were found against the Kubelet:

- * a. Ensure the --anonymous-auth argument is set to false.
- * b. Ensure that the --authorization-mode argument is set to Webhook.

Fix all of the following violations that were found against the ETCD:

* a. Ensure that the --auto-tls argument is not set to true
Hint: Take the use of Tool Kube-Bench

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

API server:

Ensure the --authorization-mode argument includes RBAC

Turn on Role Based Access Control. Role Based Access Control (RBAC) allows fine-grained control over the operations that different entities can perform on different objects in the cluster. It is recommended to use the RBAC authorization mode.

Fix - BuildtimeKubernetesapiVersion: v1

kind: Pod

metadata:

creationTimestamp: null

labels:

component: kube-apiserver

tier: control-plane

name: kube-apiserver

namespace: kube-system spec:

containers:

-command:

+ - kube-apiserver

+ - --authorization-mode=RBAC,Node

image: gcr.io/google_containers/kube-apiserver-amd64:v1.6.0

livenessProbe:

failureThreshold:8

httpGet:

host:127.0.0.1

path: /healthz

port:6443

scheme: HTTPS

initialDelaySeconds:15

timeoutSeconds:15

name: kube-apiserver-should-pass

resources:

requests: cpu: 250m

volumeMounts:

-mountPath: /etc/kubernetes/

name: k8s

readOnly:true

-mountPath: /etc/ssl/certs

name: certs

-mountPath: /etc/pki

name: pki

hostNetwork:true

volumes:

-hostPath:

path: /etc/kubernetes

name: k8s

-hostPath:

path: /etc/ssl/certs

name: certs

-hostPath:

path: /etc/pki

name: pki

Ensure the --authorization-mode argument includes Node

Remediation: Edit the API server pod specification file /etc/kubernetes/manifests/kube-apiserver.yaml on the master node and set the --authorization-mode parameter to a value that includes Node.

--authorization-mode=Node,RBAC

Audit:

/bin/ps -ef | grep kube-apiserver | grep -v grep

Expected result:

'Node,RBAC' has 'Node'

Ensure that the --profiling argument is set to false

Remediation: Edit the API server pod specification file /etc/kubernetes/manifests/kube-apiserver.yaml on the master node and set the below parameter.

--profiling=false

Audit:

/bin/ps -ef | grep kube-apiserver | grep -v grep

Expected result:

'false' is equal to 'false'

Fix all of the following violations that were found against the Kubelet:-

Ensure the --anonymous-auth argument is set to false.

Remediation: If using a Kubelet config file, edit the file to set authentication: anonymous: enabled to false. If using executable arguments, edit the kubelet service file

/etc/systemd/system/kubelet.service.d/10-kubeadm.conf

on each worker node and set the below parameter

in KUBELET_SYSTEM_PODS_ARGS

--anonymous-auth=false

variable.

Based on your system, restart the kubelet service. For example:

```
systemctl daemon-reload
systemctl restart kubelet.service
Audit:
/bin/ps -fC kubelet
Audit Config:
/bin/cat /var/lib/kubelet/config.yaml
Expected result:
'false' is equal to 'false'
*2) Ensure that the --authorization-mode argument is set to Webhook.
Audit
docker inspect kubelet | jq -e '[0].Args[] | match("--authorization-mode=Webhook").string'
Returned Value: --authorization-mode=Webhook
Fix all of the following violations that were found against the ETCD:
*a. Ensure that the --auto-tls argument is not set to true
Do not use self-signed certificates for TLS. etcd is a highly-available key value store used by Kubernetes deployments for persistent storage of all of its REST API objects. These objects are sensitive in nature and should not be available to unauthenticated clients. You should enable the client authentication via valid certificates to secure the access to the etcd service.
Fix - BuildtimeKubernetesapiVersion: v1
kind: Pod
metadata:
annotations:
scheduler.alpha.kubernetes.io/critical-pod: ""
creationTimestamp: null
labels:
component: etcd
tier: control-plane
name: etcd

- hostPath:
path: /etc/kubernetes/pki/etcd
type: DirectoryOrCreate
name: etcd-certs
status: {}
```

NEW QUESTION 5

Service is running on port 389 inside the system, find the process-id of the process, and stores the names of all the open-files inside the /candidate/KH77539/files.txt, and also delete the binary.

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

Send us your feedback on it.

NEW QUESTION 6

Fix all issues via configuration and restart the affected components to ensure the new setting takes effect. Fix all of the following violations that were found against the API server:

- * a. Ensure that the RotateKubeletServerCertificate argument is set to true.

* b. Ensure that the admission control plugin PodSecurityPolicy is set.
* c. Ensure that the --kubelet-certificate-authority argument is set as appropriate.
Fix all of the following violations that were found against the Kubelet:
* a. Ensure the --anonymous-auth argument is set to false.
* b. Ensure that the --authorization-mode argument is set to Webhook.
Fix all of the following violations that were found against the ETCD:
* a. Ensure that the --auto-tls argument is not set to true.
* b. Ensure that the --peer-auto-tls argument is not set to true.
Hint: Take the use of Tool Kube-Bench

A. Mastered
B. Not Mastered

Answer: A

Explanation:

Fix all of the following violations that were found against the API server:

* a. Ensure that the RotateKubeletServerCertificate argument is set to true.

apiVersion: v1

kind: Pod

metadata:

creationTimestamp: null

labels:

component: kubelet

tier: control-plane

name: kubelet

namespace: kube-system

spec:

containers:

- command:

- kube-controller-manager

+ - --feature-gates=RotateKubeletServerCertificate=true

image: gcr.io/google_containers/kubelet-amd64:v1.6.0

livenessProbe:

failureThreshold: 8

httpGet:

host: 127.0.0.1

path: /healthz

port: 6443

scheme: HTTPS

initialDelaySeconds: 15

timeoutSeconds: 15

name: kubelet

resources:

requests:

cpu: 250m

volumeMounts:

- mountPath: /etc/kubernetes/

name: k8s

readOnly: true

- mountPath: /etc/ssl/certs

name: certs

- mountPath: /etc/pki

name: pki

hostNetwork: true

volumes:

- hostPath:

path: /etc/kubernetes

name: k8s

- hostPath:

path: /etc/ssl/certs

name: certs

- hostPath: path: /etc/pki

name: pki

* b. Ensure that the admission control plugin PodSecurityPolicy is set.

audit: "/bin/ps -ef | grep \$apiserverbin | grep -v grep"

tests:

test_items:

- flag: "--enable-admission-plugins"

compare:

op: has

value: "PodSecurityPolicy"

set: true

remediation: |

Follow the documentation and create Pod Security Policy objects as per your environment.

Then, edit the API server pod specification file \$apiserverconf

on the master node and set the --enable-admission-plugins parameter to a value that includes PodSecurityPolicy :

--enable-admission-plugins=...,PodSecurityPolicy,...

Then restart the API Server.

scored: true

* c. Ensure that the --kubelet-certificate-authority argument is set as appropriate.

audit: "/bin/ps -ef | grep \$apiserverbin | grep -v grep"

tests:

test_items:

- flag: "--kubelet-certificate-authority"

set: true

remediation: |

Follow the Kubernetes documentation and setup the TLS connection between the apiserver and kubelets. Then, edit the API server pod specification file \$apiserverconf on the master node and set the --kubelet-certificate-authority parameter to the path to the cert file for the certificate authority.

--kubelet-certificate-authority=<ca-string>

scored: true

Fix all of the following violations that were found against the ETCD:

* a. Ensure that the --auto-tls argument is not set to true

Edit the etcd pod specification file \$etcdconf on the master node and either remove the --auto-tls parameter or set it to false. --auto-tls=false

* b. Ensure that the --peer-auto-tls argument is not set to true

Edit the etcd pod specification file \$etcdconf on the master node and either remove the --peer-auto-tls parameter or set it to false. --peer-auto-tls=false

NEW QUESTION 7

Create a PSP that will prevent the creation of privileged pods in the namespace.

Create a new PodSecurityPolicy named prevent-privileged-policy which prevents the creation of privileged pods.

Create a new ServiceAccount named psp-sa in the namespace default.

Create a new ClusterRole named prevent-role, which uses the newly created Pod Security Policy prevent-privileged-policy.

Create a new ClusterRoleBinding named prevent-role-binding, which binds the created ClusterRole prevent-role to the created SA psp-sa.

Also, Check the Configuration is working or not by trying to Create a Privileged pod, it should get failed.

A. Mastered

B. Not Mastered

Answer: A

Explanation:

Create a PSP that will prevent the creation of privileged pods in the namespace.

\$ cat clusterrole-use-privileged.yaml

--

apiVersion: rbac.authorization.k8s.io/v1

kind: ClusterRole

metadata:

name: use-privileged-psp

rules:

- apiGroups: ['policy']

resources: ['podsecuritypolicies']

verbs: ['use']

resourceNames:

- default-psp

--

apiVersion: rbac.authorization.k8s.io/v1

kind: RoleBinding

metadata:

name: privileged-role-bind

namespace: psp-test

roleRef:

apiGroup: rbac.authorization.k8s.io

kind: ClusterRole

name: use-privileged-psp

subjects:

- kind: ServiceAccount

name: privileged-sa

\$ kubectl -n psp-test apply -f clusterrole-use-privileged.yaml

After a few moments, the privileged Pod should be created.

Create a new PodSecurityPolicy named prevent-privileged-policy which prevents the creation of privileged pods.

apiVersion: policy/v1beta1

kind: PodSecurityPolicy

metadata:

name: example

spec:

privileged: false # Don't allow privileged pods!

The rest fills in some required fields.

seLinux:

rule: RunAsAny

supplementalGroups:

rule: RunAsAny

runAsUser:

rule: RunAsAny

fsGroup:

rule: RunAsAny

volumes:

- '*'

And create it with kubectl:

kubectl-admin create -f example-psp.yaml

Now, as the unprivileged user, try to create a simple pod:

kubectl-user create -f-<<EOF

apiVersion: v1

kind: Pod

metadata:

name: pause

```
spec:
containers:
- name: pause
image: k8s.gcr.io/pause
EOF
The output is similar to this:
Error from server (Forbidden): error when creating "STDIN": pods "pause" is forbidden: unable to validate against any pod security policy: []
Create a new ServiceAccount named psp-sa in the namespace default.
$ cat clusterrole-use-privileged.yaml
--
apiVersion: rbac.authorization.k8s.io/v1
kind: ClusterRole
metadata:
name: use-privileged-bsp
rules:
- apiGroups: ['policy']
resources: ['podsecuritypolicies']
verbs: ['use']
resourceNames:
- default-bsp
--
apiVersion: rbac.authorization.k8s.io/v1
kind: RoleBinding
metadata:
name: privileged-role-bind
namespace: psp-test
roleRef:
apiGroup: rbac.authorization.k8s.io
kind: ClusterRole
name: use-privileged-bsp
subjects:
- kind: ServiceAccount
name: privileged-sa
$ kubectl -n psp-test apply -f clusterrole-use-privileged.yaml
After a few moments, the privileged Pod should be created.
Create a new ClusterRole named prevent-role, which uses the newly created Pod Security Policy prevent-privileged-policy.
apiVersion: policy/v1beta1
kind: PodSecurityPolicy
metadata:
name: example
spec:
privileged: false # Don't allow privileged pods!
# The rest fills in some required fields.
seLinux:
rule: RunAsAny
supplementalGroups:
rule: RunAsAny
runAsUser:
rule: RunAsAny
fsGroup:
rule: RunAsAny
volumes:
_ '*'
And create it with kubectl:
kubectl-admin create -f example-bsp.yaml
Now, as the unprivileged user, try to create a simple pod:
kubectl-user create -f-<<EOF
apiVersion: v1
kind: Pod
metadata:
name: pause
spec:
containers:
- name: pause
image: k8s.gcr.io/pause EOF
The output is similar to this:
Error from server (Forbidden): error when creating "STDIN": pods "pause" is forbidden: unable to validate against any pod security policy: []
Create a new ClusterRoleBinding named prevent-role-binding, which binds the created ClusterRole prevent-role to the created SA psp-sa.
apiVersion: rbac.authorization.k8s.io/v1
# This role binding allows "jane" to read pods in the "default" namespace.
# You need to already have a Role named "pod-reader" in that namespace.
kind: RoleBinding
metadata:
name: read-pods
namespace: default
subjects:
# You can specify more than one "subject"
-kind: User
name: jane # "name" is case sensitive
apiGroup: rbac.authorization.k8s.io
roleRef:
# "roleRef" specifies the binding to a Role / ClusterRole
kind: Role # this must be Role or ClusterRole
```

```
name:pod-reader# this must match the name of the Role or ClusterRole you wish to bind to
apiGroup:rbac.authorization.k8s.io apiVersion:rbac.authorization.k8s.io/v1
kind:Role
metadata:
namespace:default
name:pod-reader
rules:
- apiGroups:[""]# "" indicates the core API group
resources:["pods"]
verbs:["get","watch","list"]
```

NEW QUESTION 8

Using the runtime detection tool Falco, Analyse the container behavior for at least 30 seconds, using filters that detect newly spawning and executing processes store the incident file art /opt/falco-incident.txt, containing the detected incidents. one per line, in the format [timestamp],[uid],[user-name],[processName]

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

Send us your suggestion on it.

NEW QUESTION 9

Create a Pod name Nginx-pod inside the namespace testing, Create a service for the Nginx-pod named nginx-svc, using the ingress of your choice, run the ingress on tls, secure port.

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

Send us your feedback on it.

NEW QUESTION 10

Analyze and edit the given Dockerfile

```
FROM ubuntu:latest
RUN apt-getupdate -y
RUN apt-install nginx -y
COPY entrypoint.sh /
ENTRYPOINT ["/entrypoint.sh"]
USER ROOT
```

Fixing two instructions present in the file being prominent security best practice issues

Analyze and edit the deployment manifest file

```
apiVersion: v1
kind: Pod
metadata:
name: security-context-demo-2
spec:
```

```
securityContext:
```

```
runAsUser: 1000
```

```
containers:
```

```
- name: sec-ctx-demo-2
```

```
image: gcr.io/google-samples/node-hello:1.0
```

```
securityContext:
```

```
runAsUser: 0
```

```
privileged:True
```

```
allowPrivilegeEscalation:false
```

Fixing two fields present in the file being prominent security best practice issues

Don't add or remove configuration settings; only modify the existing configuration settings

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

Whenever you need an unprivileged user for any of the tasks, use user test-user with the user id 5487 Send us the Feedback on it.

NEW QUESTION 10

* a. Retrieve the content of the existing secret named default-token-xxxxx in the testing namespace.

Store the value of the token in the token.txt

* b. Create a new secret named test-db-secret in the DB namespace with the following content: username: mysql

password: password@123

Create the Pod name test-db-pod of image nginx in the namespace db that can access test-db-secret via a volume at path /etc/mysql-credentials

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

To add a Kubernetes cluster to your project, group, or instance:

Navigate to your:

Project's Operations > Kubernetes

page, for a project-level cluster.

Group's Kubernetes

page, for a group-level cluster.

Admin Area > Kubernetes

page, for an instance-level cluster.

Click Add Kubernetes cluster.

Click the Add existing cluster

tab and fill in the details:

Kubernetes cluster name (required) - The name you wish to give the cluster.

Environment scope (required) - The associated environment to this cluster.

API URL (required) - It's the URL that GitLab uses to access the Kubernetes API. Kubernetes exposes several APIs, we want the "base" URL that is common to all of them. For

example, <https://kubernetes.example.com> rather than <https://kubernetes.example.com/api/v1>.

Get the API URL by running this command:

```
kubectl cluster-info | grep -E 'Kubernetes master|Kubernetes control plane' | awk '/http/ {print $NF}'
```

CA certificate (required) - A valid Kubernetes certificate is needed to authenticate to the cluster.

We use the certificate created by default.

List the secrets with `kubectl get secrets`, and one should be named similar to `default-token-xxxxx`. Copy that token name for use below.

Get the certificate by running this command: `kubectl get secret <secret name>-ojsonpath='{["data"]["ca.crt"]}'`

NEW QUESTION 15

Create a network policy named `allow-np`, that allows pod in the namespace `staging` to connect to port 80 of other pods in the same namespace.

Ensure that Network Policy:

* 1. Does not allow access to pod not listening on port 80.

* 2. Does not allow access from Pods, not in namespace `staging`.

A. Mastered

B. Not Mastered

Answer: A

Explanation:

```
apiVersion:networking.k8s.io/v1
```

```
kind:NetworkPolicy
```

```
metadata:
```

```
name:network-policy
```

```
spec:
```

```
podSelector:{} #selects all the pods in the namespace deployed
```

```
policyTypes:
```

```
-Ingress
```

```
ingress:
```

```
-ports:#in input traffic allowed only through 80 port only
```

```
-protocol:TCP
```

```
port:80
```

NEW QUESTION 19

use the Trivy to scan the following images,

* 1. `amazonlinux:1`

* 2. `k8s.gcr.io/kube-controller-manager:v1.18.6`

Look for images with HIGH or CRITICAL severity vulnerabilities and store the output of the same in

`/opt/trivy-vulnerable.txt`

A. Mastered

B. Not Mastered

Answer: A

Explanation:

Send us your suggestion on it.
